

Al Noor Hospital Website — Free Setup Guide (No Card Needed)

This package contains your website with two automations, both **100% free, no credit card, no ongoing cost**:

1. **Working staff email form** — submissions are captured by Netlify and can email you automatically.
2. **FAQ chatbot** — a chat bubble (bottom-right) that instantly answers common visitor questions (doctors, OPD timings, departments, location, contact info) using simple built-in logic — no external AI service, so nothing to pay for.

Total setup time: ~15 minutes. You only need a GitHub account and a Netlify account (both free, just need an email address).

Step 1 — Put the files on GitHub

1. Go to <https://github.com> and create a free account (just needs your email) if you don't have one.
2. Click **New repository**. Name it e.g. `alnoor-hospital-site`. Public or Private, either is fine. Click **Create repository**.
3. On the repo page, click **Add file → Upload files**.
4. Upload `index.html` and `netlify.toml` from this package.
5. Click **Commit changes**.

Step 2 — Deploy to Netlify (free, no card)

1. Go to <https://app.netlify.com> and sign up — you can use your GitHub account to sign up, which makes this step faster.
2. Click **Add new site → Import an existing project**.
3. Choose **GitHub**, authorize Netlify, and select the `alnoor-hospital-site` repo.
4. Leave the build settings as-is (publish directory `.`) and click **Deploy site**.
5. In 1–2 minutes your site is live at a free address like `https://your-site-name.netlify.app`.

Step 3 — Turn on email notifications for the staff form

1. Open your live site and submit one test staff email request — Netlify only detects a form after it's actually submitted once from the live URL.
2. In Netlify, go to **Site configuration** → **Forms** — you should now see the `email-request` form listed.
3. Go to **Forms** → **Notifications** → **Add notification** → **Email notification**, enter the email that should receive requests (e.g. `surgeongnk@gmail.com`), and save.
4. From now on, every submission is emailed to you automatically and also viewable under **Forms** in Netlify.

Step 4 — (Optional) Add your own domain name

This is the only part that isn't free if you want a custom domain like `alnoorhospital.com` — domain names typically cost \$10-15/year from a registrar.

1. In Netlify, go to **Domain management** → **Add a domain**.
2. Either buy a domain through Netlify, or point an existing domain's DNS to Netlify (Netlify shows the

exact records to add).

3. HTTPS is issued automatically and free once DNS is connected.

If you're fine with the free `.netlify.app` address, skip this step entirely — the site is already fully live and functional without it.

How the chatbot works

It's a small set of keyword-matching rules built directly into `index.html` (search for `const rules =`). When a visitor's message contains a matching keyword (like "timing" or "doctor"), it replies with the matching answer. This has no running cost and needs no external service.

To add or edit answers later: open `index.html`, find the `rules` array near the bottom, and add a line like:

```
{ keys: ['parking'], reply: "Parking is  
available in front of the main entrance."  
},
```

Then re-upload the file to GitHub — Netlify redeploys automatically within a minute.

If you ever want the smarter AI version later

The earlier package I gave you (with a real AI chatbot powered by Claude) is still available if you decide the small pay-as-you-go API cost is worth it down the road — just let me know and I'll walk you through swapping it in.

If something goes wrong

- **Form submissions aren't showing up:** make sure you submitted a test request from your *live* Netlify URL, not by opening the file directly on your phone/computer.
- **Chatbot gives the fallback "I'm not sure"**
answer a lot: add more keyword rules for the topics your visitors actually ask about.
- **Need to edit hospital info:** edit `index.html`, re-upload to GitHub, Netlify redeploys automatically.
